

LLM CLI for Academic Paper Analysis

Please find attached an academic paper that explores the differences between **Large Language Model (LLM) systems** and **Agentic AI systems**.

Task

Each student is required to read the attached paper and then design and implement a **Command Line Interface (CLI) application** powered by a Large Language Model (LLM). This CLI will interpret the attached paper and answer questions solely on the content of the paper..

CLI Requirements

Your CLI application must:

- Accept user questions via the command line.
- Interpret and analyse the provided academic paper.
- Generate answers **based solely on the content of the paper**.
- Avoid using external knowledge beyond the provided document.

Video Demonstration Requirement

You must submit a recorded video (5–8 minutes) demonstrating your CLI application.

The video should include:

- A brief overview of your system
- A live demonstration of the CLI
- At least 3–5 example questions about the paper
- The corresponding answers generated by your system
- A short explanation of how your system ensures answers are based only on the paper

The demonstration should clearly show that your application is functioning correctly and meeting the assignment requirements.

Objective: The goal of this assessment is to demonstrate your ability to:

- Apply LLMs to a real-world task
- Extract and utilise relevant information from a structured academic source
- Build an interactive CLI-based application
- To integrate with a locally hosted LLM using Ollama.
- Apply a model such as Llama 3, which is supported by Ollama and suitable for question-answering tasks.
